**Directional FM Antenna  
Way Media, Inc.  
KXWA  
Centennial, CO**

A standard model PSIFML antenna was used in conjunction with the customer's 4-5/8" diameter support mast to create the necessary directional radiation pattern. The final antenna consists of a single radiating element, three vertical and two horizontal parasitic elements secured with custom mounts.

Pattern testing was performed using a 1/3 scale model element and mast. The azimuth plane measurements were taken on a ground reflection test range. This type of test range utilizes the reflected signal and direct signal from the source antenna to form an interference pattern on the antenna under test. The antenna and mast under test was mounted to a turntable that allowed the structure to be rotated 360° in the azimuth plane. The source antenna was located approximately 75 ft. from the antenna under test. The source height above ground was adjusted to peak the first lobe of the interference pattern at the antenna under test.

The test antenna was mounted in the center of rotation of the turntable. The antenna and mounting structure were rotated clockwise while data was recorded in a counter clockwise direction. All feed cables to the antenna were secured and grounded during pattern measurements. A Hewlett Packard 8753E-network analyzer operating at 305.7 MHz was used as both the source and receiver. The level of the received signal was compared with a standard dipole to establish the directivity of the final pattern. The final pattern measured does not exceed the envelope pattern and is 90.5% of the envelope RMS.

The antenna is to be mounted with the center of radiation at 15 meters (49.2 ft.) above ground level on a customer supplied support mast. At this elevation the antenna will be within the allowed +2m/-4m tolerance from the approved height above ground level. No other antenna can be installed within 10 ft of any radiating element. The antenna is to be positioned 130° True and certified by a licensed surveyor. It is recommended that a broadcast engineer is present to supervise the installation of the antenna and that he or she certifies the antenna has been installed according to the enclosed instructions.

An input power level of .391 kW will be required at the antenna input in order to reach the licensed .5 kW ERP. The transmitter output power requirements are dependent upon the transmission line size and length used to feed the antenna.

### **Antenna Specifications**

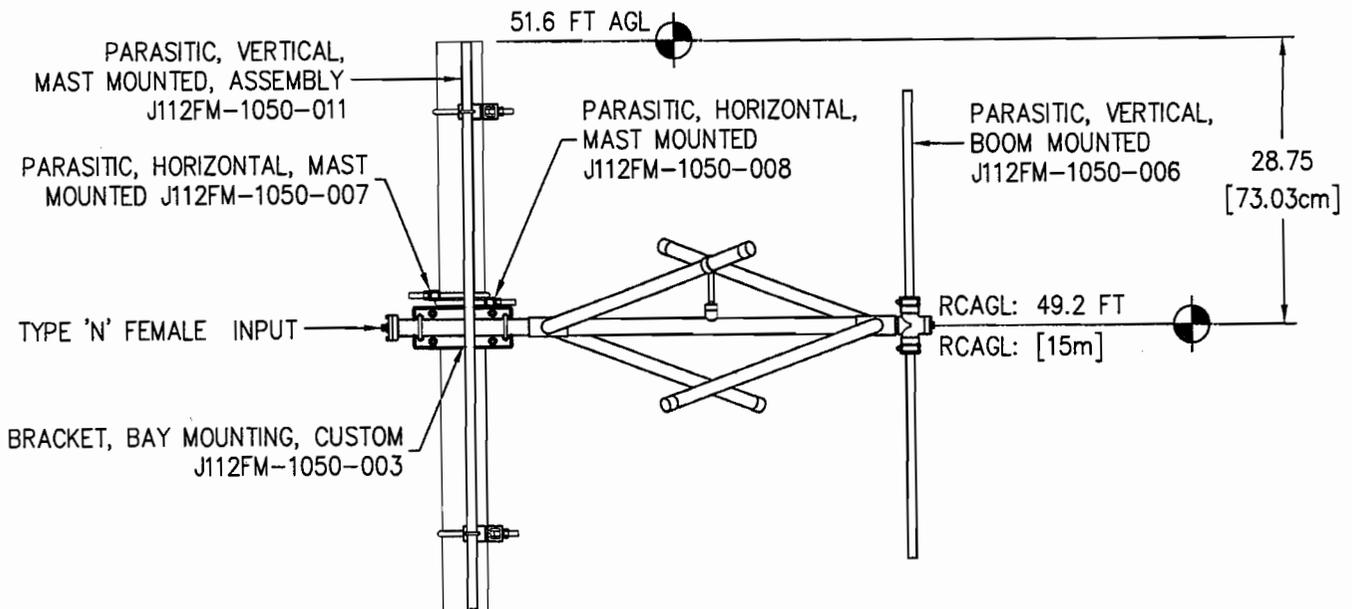

Antenna Model	PSIFML-1A-DA
Type	1-bay directional FM antenna
Frequency	101.9 MHz
Polarization	Circular
Envelope RMS	.673
Composite RMS	.609
Gain (h-pol)	1.28 (1.07 dB)
Gain (V-pol)	1.13 (.53 dB)
Antenna input power	.391 kW
Input	Type "N" female
Power rating	.750 kW
Length	4.8 ft.
Weight	47.5 lbs.
Wind Area	7.6 sq. ft.

### **Statement of Certification**

This is to certify the antenna has been designed, fabricated and tested under my supervision and it meets the required envelope pattern limitations set forth in the stations construction permit.

Douglas A. Ross
