**Engineering Statement
FM Translator K280FJ
NIER Study for License Application
September 2010**

Background

FM translator K280FJ has been constructed as authorized in BPFT-20100312AAW on Channel 280D (103.9 MHz) with a maximum lobe effective radiated power of 250 watts. The antenna is installed on a wooden pole on Sevenmile Hill, adjacent to the tower on which the combined operations of KACI-FM and KMSW are located.

The construction permit bears a condition which states:

Warning signs which describe the radiofrequency electromagnetic field radiation hazard must be posted at appropriate intervals. Access must be restricted to prevent the exposure of humans to RF emissions in excess of the FCC guidelines (OET Bulletin 65, Edition 97-01, released August 1997). Permittee shall submit documentation of compliance with this special operating condition when filing FCC Form 350, application for license.

Based on the calculations which are detailed below, it is my considered engineering judgement that no warning signs or site access controls are necessary in the instant case.

NIER Calculations

The power density calculations shown below were made using the techniques outlined in OET Bulletin No. 65. "Ground level" calculations in this report have been made at a reference height of 2 meters above ground to provide a worst-case estimate of exposure for persons standing on the ground in the vicinity of the tower. The equation shown below was used to calculate the ground level power density figures from each antenna.

$$S(\text{mW/cm}^2) = \frac{33.40981 \times \text{AdjERP(Watts)}}{D^2}$$

Where: *AdjERP(Watts)* is the maximum lobe effective radiated power times the element pattern factor times the array pattern factor.

D is the distance in meters from the center of radiation to the calculation point.

Ground level power densities have been calculated for locations extending from the base of the tower to a distance of 1000 meters. Values past this point are increasingly negligible.

Calculations of the power density produced by the K280FJ antenna system have been made using the manufacturer's vertical plane pattern for the Scala HDCA5-CP antenna to be used. The highest calculated ground level power density occurs at a distance of 11 meters from the base of the antenna support structure. At this point the power density is calculated to be $40.7 \mu\text{W}/\text{cm}^2$.

The Scala HDCA5-CP antenna utilized for this installation is a single antenna, not an array. Included with this Engineering Statement is a complete tabulation of the Scala HDCA5-CP vertical plane radiation pattern as provided by Scala (the antenna manufacturer) along with the calculated ground-level power density from the antenna at 1 meter increments from the antenna. A sample calculation is provided to demonstrate that these calculations were performed correctly using appropriate mathematical principles and the formula from OET Bulletin No. 65.

Calculations of the power density produced by the KACI-FM and KMSW(FM) antenna systems have been made using the Commission's FMMModel software program, and are summarized in the following table:

Call	Avg or Peak ERP Antenna Model	Antenna Height AGL	Calculated Max Exposure	Gen Pub FCC Limit	% of Limit
K280FJ 280D	0.25 kW avg Scala HDCA5-CP	10 m	$40.7 \mu\text{W}/\text{cm}^2$	$200 \mu\text{W}/\text{cm}^2$	20.4%
KACI-FM	5.1 kW avg JAM JMPC-2	42 m	$39.9 \mu\text{W}/\text{cm}^2$	$200 \mu\text{W}/\text{cm}^2$	20.0%
KMSW(FM)	3.4 kW avg JAM JMPC-2	42 m	$26.6 \mu\text{W}/\text{cm}^2$	$200 \mu\text{W}/\text{cm}^2$	13.3%

These calculations show that the maximum calculated power density produced at two meters above ground level by the operation of K280FJ and the operations of the other stations at this site (were their maxima to coincide, which they do not) is 51.7% of the FCC standard for uncontrolled environments. Therefore, no warning signs or site access controls are necessary in the instant case.

Alternative Worst-Case Method

The K280FJ antenna is installed on a wooden pole which is 43 meters horizontally from the tower on which the KACI-FM/KMSW antenna is installed. Even if one assumes use of the "worst case" ring-stub element pattern for the K280FJ antenna, it is clear from review of the power density data calculated by the FMMModel software that all of these stations produce their highest calculated ground level power density values at less than 43 meters from their antennas. The highest calculated value from K280FJ is $156.8 \mu\text{W}/\text{cm}^2$ at 2 meters, and the highest calculated value from the combined KACI-FM/KMSW operation is $66.6 \mu\text{W}/\text{cm}^2$ at 23 meters.

On the following spreadsheet, the values calculated by FMMModel have been summed at 1 meter increments between the two antenna support structures. The maximum total calculated ground level power density along this line is $191.5 \mu\text{W}/\text{cm}^2$, which is 95.8% of the FCC standard for uncontrolled environments.

In fact, since the K280FJ antenna is highly directional and pointed roughly perpendicular to the line

between the two tower sites, the actual ground level power densities along this line would be expected to be significantly lower than indicated by this worst-case calculation.

Sum of K280FJ and KACI-FM/KMSW Contributions

Along the Line Between the Antennas

(43 meter distance between tower sites)

Statement of Engineer

This Engineering Statement, relative to the license application for FM translator K280FJ at The Dalles, Oregon, has been prepared by the undersigned. All representations contained herein are true to the best of my knowledge. I am an experienced radio engineer whose qualifications are a matter of record with the Federal Communications Commission. I am a staff engineer in the firm of Hatfield and Dawson Consulting Engineers and am Registered as a Professional Engineer in the States of Washington and Colorado.

September 30, 2010

Erik C. Swanson, P.E.

Sample Calculation

At 11 meters from the base of the antenna support structure, the slant distance to a point 2 meters above ground level is 13.6 meters. This is determined by simple trigonometry, determining the length of the hypotenuse for a right triangle which is 11 meters along the base and 8 meters in height:

$$a^2 + b^2 = c^2$$

$$11^2 + 8^2 = c^2$$

$$c = 13.6 \text{ meters} = \text{hypotenuse}$$

The corresponding depression angle is identical to the angle between the base and hypotenuse, and is determined here as the inverse of the sine of the height over the hypotenuse of the right triangle:

$$\sin(\text{angle}) = \text{opposite} / \text{hypotenuse}$$

$$\sin(\text{angle}) = 8 / 13.6$$

$$\sin(\text{angle}) = 0.5882$$

$$\text{angle} = 36.03 \text{ degrees}$$

From the vertical plane pattern tabulation for the Scala HDCA5-CP antenna, the relative field value at a depression angle of 36 degrees is 0.672. We use this relative field value to arrive at the adjusted ERP in watts at the depression angle:

$$\text{adjusted ERP} = (\text{watts H} + \text{watts V}) (\text{relative field squared})$$

$$\text{adjusted ERP} = (250 + 250) (0.672^2)$$

$$\text{adjusted ERP} = 225.8 \text{ watts}$$

By plugging this value into the formula from OET Bulletin 65, we arrive at the calculated ground-level power density:

$$S(\text{mW/cm}^2) = \frac{33.40981 \times \text{AdjERP(Watts)}}{D^2}$$

Where: *AdjERP(Watts)* is the maximum lobe effective radiated power times the element pattern factor times the array pattern factor.

D is the distance in meters from the center of radiation to the calculation point.

Thus, for an adjusted ERP of 225.8 watts and a distance of 13.6 meters, *S* is calculated to equal 40.8 $\mu\text{W}/\text{cm}^2$. This calculated value is slightly (just 0.1 $\mu\text{W}/\text{cm}^2$) higher than that indicated on the attached spreadsheet, owing to the fact that the spreadsheet takes the extra step of interpolating the relative field value at a depression angle 36.03 degrees.
