Quality Broadcast Antenna Systems

**Directional FM Antenna
Radio Free Moscow, Inc.
KRFP
Moscow, ID**

A standard model PSIFML-HR antenna was used in conjunction with the customer's Rohn SSV tower and existing support mast to create the necessary directional radiation pattern. The final antenna consists of two radiating elements secured to the mast with custom mounting brackets. There is one horizontal parasitic element and one vertical parasitic element per bay. The antenna bays are .735-wavelength spaced and each radiating element receives equal power and phase.

Pattern testing was performed using a 1/3 scale model element, tower and mast. The azimuth plane measurements were taken on a ground reflection test range. This type of test range utilizes the reflected signal and direct signal from the source antenna to form an interference pattern on the antenna under test. The antenna, tower and mast under test were mounted to a turntable that allowed the structure to be rotated 360° in the azimuth plane. The source antenna was located approximately 75 ft. from the antenna under test. The source height above ground was adjusted to peak the first lobe of the interference pattern at the antenna under test.

The test antenna was mounted in the center of rotation of the turntable. The antenna and mounting structure were rotated clockwise while data was recorded in a counter clockwise direction. All feed cables to the antenna were secured and grounded during pattern measurements. A Hewlett Packard 8753E-network analyzer operating at 270.9 MHz was used as both the source and receiver. The level of the received signal was compared with a standard dipole to establish the directivity of the final pattern. The final pattern measured does not exceed the envelope pattern and is 92.8% of the envelope RMS.

The antenna is to be mounted with the center of radiation at 48.7 meters (159.7 ft.) above ground level on the support mast. At this elevation the antenna is within the allowed +/- 2m/4m tolerance from the approved 47 meter center of radiation. The antenna is to be positioned 0° True and certified by a licensed surveyor. It is recommended that a broadcast engineer is present to supervise the installation of the antenna and that he or she certifies the antenna has been installed according to the enclosed instructions.

An input power level of .659 kW will be required at the antenna input in order to reach the licensed 1.1 kW ERP. The transmitter output power requirements are dependent upon the transmission line size and length used to feed the antenna.

Antenna Specifications

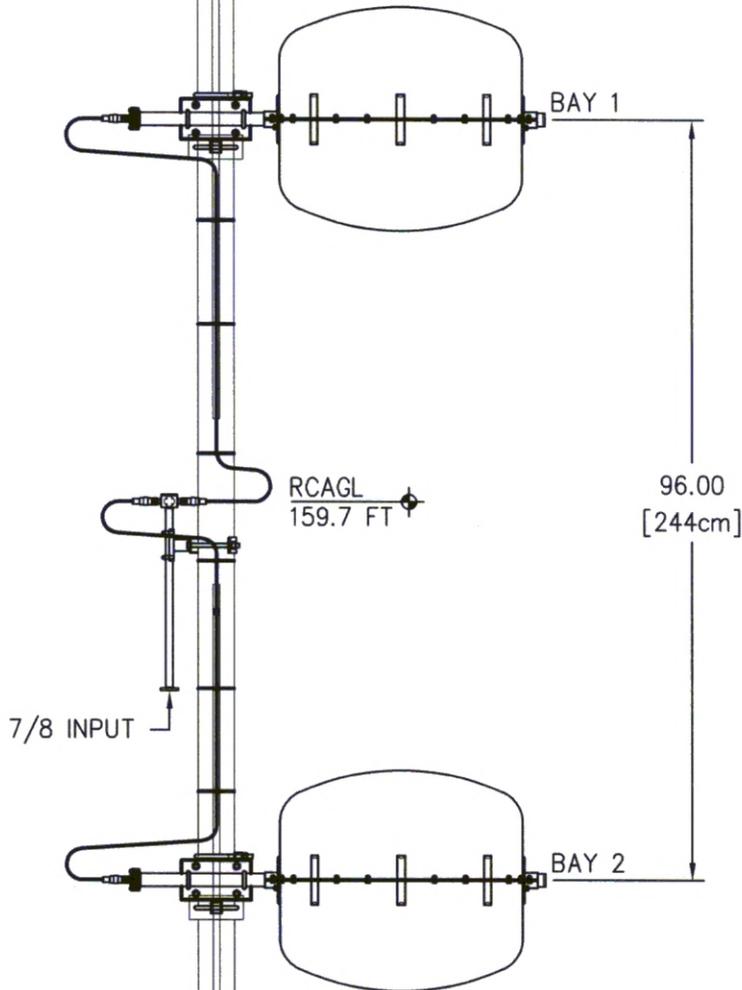

Antenna Model	PSIFML-2A-HR-DA
Type	2-bay directional FM antenna
Bay Spacing	.735-wavelength spaced elements with radomes
Frequency	90.3 MHz
Polarization	Circular
Envelope RMS	.789
Composite RMS	.732
Gain (h-pol)	1.67 (2.23 dB)
Gain (V-pol)	1.62 (2.10 dB)
Antenna input power	.659 kW
ERP	1.1 kW (.41 dBK)
Input	7/8" EIA center fed input
Power rating	1.0 kW
Length (aperture)	8.0 ft.
Antenna Weight	181 lbs.
Antenna Wind Area	15.1 sq. ft.

Statement of Certification

This is to certify the antenna has been designed, fabricated and tested under my supervision and it meets the required envelope pattern limitations set forth in the stations construction permit.

 8/1/2017
