

Exhibit E-30

The proposed facility would operate with a low effective radiated power from an existing tower site. As a result, the levels of non-ionizing radiation at ground level would not exceed those permitted under the uncontrolled environment condition of the IEEE C95.1-1999 safety standard. The proponent will cooperate with all other users of the site by reducing power or ceasing operation as necessary to protect workers from being exposed to levels of non-ionizing radiation which would be considered hazardous under the appropriate conditions of the applicable safety standards. It is therefore respectfully submitted that the proposed facility should be exempt from environmental processing.
