

# **KLEIN BROADCAST ENGINEERING, L.L.C.**

*dedicated to improving the science and technology of radio & television communications*

**ENGINEERING EXHIBIT E-4  
PREPARED IN SUPPORT  
OF A FCC FORM 301 APPLICATION  
(A MINOR CHANGE)  
FM STATION K C U V (FM)  
(FCC FACILITY ID 37028)  
GREENWOOD VILLAGE, COLORADO**

**Engineering Exhibit E-4, was prepared on behalf of FM Station KCUV(FM) at Greenwood Village, Colorado, in support of its qualification to provide the Commission with an exhibit that shows compliance with 47 CFR Section 73.315 of the Commission's Rules, using an alternate method of contour prediction.**

**The purpose of this exhibit is to provide information demonstrating that a supplemental showing is warranted based on the FCC's guidelines for considering supplemental showings in the context of compliance with the coverage of the community of license (47 CFR Section 73.315). This exhibit demonstrates the instant application for a minor change complies with the community of license coverage requirements of 47 CFR Section 73.315 based on this supplemental showing.**

**Station KCUV(FM) is presently licensed (FCC File No. BLH-20051110ACE) to operate on FM Channel 272 A at Greenwood Village, Colorado, with an effective radiated power (ERP) of 6kW and an antenna height above average terrain of 64 meters (HAAT). The instant application, a minor change, seeks to specify operation on FM Channel 272 A at Greenwood Village, Colorado, also but with different facilities and different location than presently authorized.**

**Engineering Exhibit E-4 cont'd page two: KCUV(FM)**

**The purpose of the instant application is to operate KCUV as a maximum Class A facility and change transmitter location. It is proposed to operate KCUV(FM) with a facility that will operate with 1.0kW ERP at 238 meters HAAT ( a full Class A facility for 238 meters HAAT). The application proposes operation as a 47 CFR Section 73.207 authorized station.**

**Demonstration that Consideration of a Supplemental Showing is Warranted**

**The predicted 70dBu contour, based on the FCC's standard prediction method will not provide coverage to at least 80% of the principal community, Greenwood Village, Colorado, from the proposed 47 CFR Section 73.207 transmitter site. However, using terrain sensitive propagation modeling, the 70dBu coverage contour is predicted to encompass at least 80% of Greenwood Village, Colorado. (see Longley-Rice/Free Space Coverage) as required by the Commission's Rules. It is believed that a supplemental showing using an alternative contour prediction method is justified in this instance in accordance with 47 CFR Section 73.313(e) due to the "widely varying" terrain along the radials towards the community of license, Greenwood Village, Colorado. In this regard, it is noted that the f(50,50) curves presume average terrain with a terrain roughness or delta h of 50 meters, whereas based on the methods of 47 CFR Section 73.313, delta h was determined to be between 205.66 and 309.18 meters along several radials through Greenwood Village, Colorado, with the average being 246.76 meters.**

**EXHIBIT E-4 cont'd page three: KCUV(FM)**

Specifically, delta h was determined at 114 degrees true, the direct radial bearing through the center of the Principal Community, Greenwood Village, Colorado. A reference point was also established although the reference point is not close to the geographic center of the community. That reference point was determined from the Geographic Names Information System. Delta H was determined along the radials of 110 degrees true, 112 degrees true, 114 degrees true, 116 degrees true and 118 degrees from 0 kilometers distance to 35.8kM, 36.3kM, 36.7kM, 37.3kM and 35.9kM respectively, on each of the five radials from the proposed Section 73.207 transmitter site. The actual distance to the furthest community limit boundary of Greenwood Village on each radial is: 110 degrees = 34.8 kilometers, 112 degrees = 35.3 kilometers, 114 degrees = 35.7 kilometers, 116 degrees = 36.7 kilometers and 118 degrees = 34.9 kilometers. This writer ran the radials out approximately 1 kilometer distance past the principal community boundary to insure a calculation past the most distant community of license boundary on each radial. All of the terrain data was derived from the Defense Mapping agency 3 Arc Second Terrain Datafile. (DMA 3 Arc Second Digitized Terrain Datafile) The specific delta h calculations are as follows:

110 degrees true = 205.66 meters delta h (0 to 35.8 kilometers)

112 degrees true = 216.56 meters delta h (0 to 36.3 kilometers)

114 degrees true = 237.64 meters delta h (0 to 36.7 kilometers)

116 degrees true = 264.74 meters delta h (0 to 37.3 kilometers)

118 degree true = 309.18 meters delta h (0 to 35.9 kilometers)

Average = 246.76 meters delta h

**EXHIBIT E-4 cont'd page four: KCUV(FM)**

**In addition to the above radials, we have calculated the 3 to 16 kilometer delta h for the following radials:**

102 degrees true = 138.60 meters delta h (3 to 16 kilometers)  
104 degrees true = 144.47 meters delta h (3 to 16 kilometers)  
106 degrees true = 182.23 meters delta h (3 to 16 kilometers)  
108 degrees true = 196.44 meters delta h (3 to 16 kilometers)  
110 degrees true = 184.29 meters delta h (3 to 16 kilometers)  
112 degrees true = 185.26 meters delta h (3 to 16 kilometers)  
114 degrees true = 187.82 meters delta h (3 to 16 kilometers)  
116 degrees true = 189.33 meters delta h (3 to 16 kilometers)  
118 degrees true = 163.10 meters delta h (3 to 16 kilometers)  
120 degrees true = 139.33 meters delta h (3 to 16 kilometers)  
122 degrees true = 153.27 meters delta h (3 to 16 kilometers)  
124 degrees true = 173.99 meters delta h (3 to 16 kilometers)  
126 degrees true = 198.74 meters delta h (3 to 16 kilometers)

Average = 172.06 meters delta h

The FCC considers terrain to “depart widely” from the 50 meter delta h standard where the delta h value is 20 meters or less or 100 meters or greater, as indicated above delta h was determined to be between 205.66 and 309.18 meters along the radials through Greenwood Village, Colorado with the average delta h for those radials of 246.76 meters. Furthermore, the FCC has previously accepted the use of an alternate method to determine the location of the principal community contour for more than several proposals, specifically KRFR at Shafter, California and KALF at Red Bluff, California and KSRV-FM, at Ontario, Oregon. The Commission has allowed the use of an alternate contour prediction method when the delta h was less than 20 meters or more than 100 meters on the radials toward the principal community from the proposed transmitter site as is the case herein.

**EXHIBIT E-4 cont'd page five: KCUV(FM)**

**Longley-Rice / Free Space Coverage**

**Both the Longley-Rice prediction method (Rice, P.L., A.G. Longley, K.A. Norton and A.P. Barsis, "Transmission Loss Predictions for Tropospheric Communications Circuits," Technical Note 101 Issued May 7, 1965, Revised January 1, 1967, National Bureau of Standards, Boulder, Colorado.) see also (Longley, A.G. and P.L. Rice, "Prediction of Tropospheric Radio Transmission Loss Over Irregular Terrain; A Computer Method-1969" "ESSA Technical Report ERL-ITS 67, Institute for Telecommunications Sciences, Boulder, Colorado, July 1968.) and the Free Space Method are used for more precise alternatives to the Commission's standard contour prediction method to determine the location of the proposed KCUV(FM) 70dBu contour.**

**For the Longley Rice method, terrain profiles were prepared for the 110 degree T. radial, the 112 degree T. radial, the 114 degree T. radial, the 116 degree T radial, and the 118 degree T. radial. Exhibits E4-A, E4-B, E4-C, E4-D and E4-E depict the true terrain profiles for these radials. The terrain data was derived from the Defense Mapping Agency 3 Arc Second Terrain Database.**

**EXHIBIT E-4 cont'd page six: KCUV(FM)**

**Using these terrain elevations , calculations of field strength were made along each radial using the Longley-Rice prediction method. The following parameters were employed in the calculations:**

<b>Model:</b>	<b>Point to Point Irregular</b>
<b>Radio Climate:</b>	<b>Continental Temperate</b>
<b>Surface Refractivity:</b>	<b>301</b>
<b>Location Variability:</b>	<b>50%</b>
<b>Time Variability:</b>	<b>50%</b>
<b>Situation Variability:</b>	<b>50%</b>
<b>Frequency:</b>	<b>102.3mHz.</b>
<b>Polarization:</b>	<b>Horizontal</b>
<b>Conductivity:</b>	<b>0.004 m/S</b>
<b>Dielectric Constant:</b>	<b>15.0</b>
<b>Transmitter Antenna Height AMSL:</b>	<b>2256 meters</b>
<b>Transmitting Antenna:</b>	<b>Omni-Directional</b>
<b>Maximum Effective Radiated Power:</b>	<b>1.0kW</b>
<b>Receive Antenna Height AGL:</b>	<b>9 meters</b>
<b>Clutter Factor:</b>	<b>0 &amp; 3.0dB</b>

**As indicated a zero clutter factor and a 3dB clutter factor was used to take into account field strength variations due to local clutter (e.g. trees, buildings and other structures) The use of a 3.0dB clutter factor appears conservative here. For instance , a 2 dB clutter factor was used by O.E.T. to establish that KALF-FM encompassed its main studio location with its principal community contour in the Engineering Memorandum issued by O.E.T.**

**September 1992.**

**In addition Bullington indicated that the average loss for surrounding trees for horizontal polarization may be 2 to 3 dB (see Kenneth Bullington, "Radio Propagation Above 30 Megacycles, Proc IRE, October 1947)**

**EXHIBIT E-4 cont'd page seven: KCUV(FM)**

The calculated field strength at the respective end point for each of the five pertinent radials is tabulated here. The distance is listed from the proposed Section 73.207 transmitter site using the Longley-Rice method is as follows for each radial calculated:

110 degrees true = 35.8 kilometers = 73.82 dBu  
112 degrees true = 36.3 kilometers = 73.60 dBu  
114 degrees true = 36.7 kilometers = 73.60 dBu  
116 degrees true = 37.3 kilometers = 73.46 dBu  
118 degrees true = 35.9 kilometers = 74.19 dBu

The calculated distance to the 70dBu field strength level using the Longley-Rice method is as follows for the radials of concern:

110 degrees true distance to 70dBu contour = 41.27 kM  
112 degrees true distance to 70dBu contour = 41.02 kM  
114 degrees true distance to 70dBu contour = 40.55 kM  
116 degrees true distance to 70dBu contour = 39.98 kM  
118 degrees true distance to 70dBu contour = 39.34 kM

The distances for the 70dBu contour using the FCC Standard Prediction Method f(50,50) for the radials of concern are as follows:

110 degrees true distance to 70dBu contour = 22.92 kM  
112 degrees true distance to 70dBu contour = 22.66 kM  
114 degrees true distance to 70dBu contour = 22.42 kM  
116 degrees true distance to 70dBu contour = 22.08 kM  
118 degrees true distance to 70dBu contour = 21.74 kM

The preceding tabulations for the distances to the 70dBu contour using the FCC Standard Prediction Method and above that using the Longley-Rice Method shows a greater than 10% difference in predicted distances to the 70dBu contour of concern.

**EXHIBIT E-4 cont'd page eight: KCUV(FM)**

The following will provide a sample of the Longley-Rice method predicted field strength at the Greenwood Village, Colorado, geographic reference location:

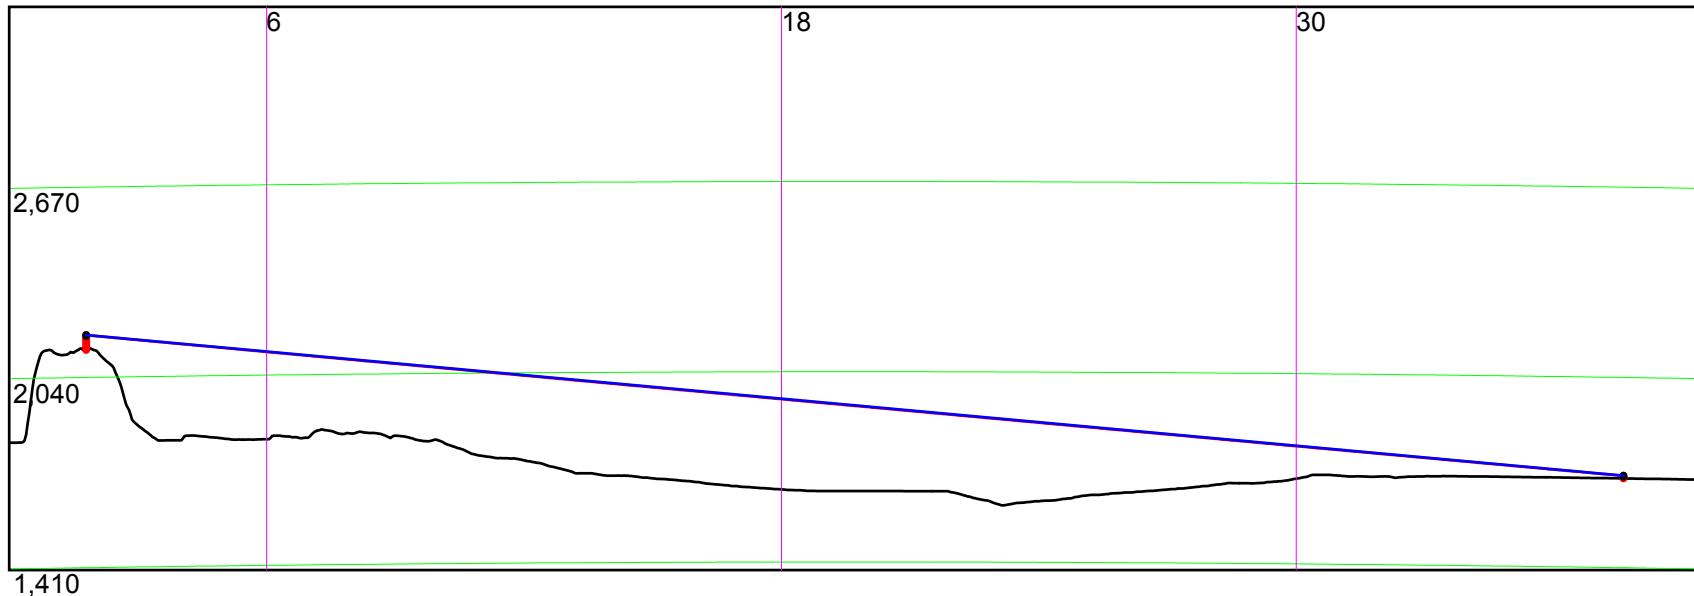

**NL: 39-37-02 / WL: 104-57-01 (NAD-27)  
Distance is 27.68 kilometers from transmitter site  
Free Space Field with (1.0kW / 0.0dBk) 78.06 dBu  
Additional Estimated Transmission Loss -0.5 dB  
Clutter Loss -5.0dB  
Longley-Rice Predicted Net field strength of 72.56 dBu**

From the preceding it can be assumed that the entire principal community will receive 70dBu and greater signal strength over 100% of the community of license, Greenwood Village, Colorado.

**Conclusion**

As demonstrated above, use of a supplemental showing is warranted based on the FCC's guidelines for considering supplemental showings in the context compliance with coverage of the of the community of license, principal community coverage requirements of 47 CFR Section 73.315 based on the allowable supplemental showing.

**EXHIBIT E-4L****KCUV(FM) 70dBu Contour Analysis w/Alternate Methods**

Klein Broadcast Engineering, L.L.C.

Job: KCUV LOOKOUT 20060929.fmj

Master Database: 2006\_Sep\_29.fmd

Lat: N39:36:23 Lon: W104:52:39 NAD-27(Map Center)

Scale: 1:375000

Channel: 272 Class: A

Status: Application

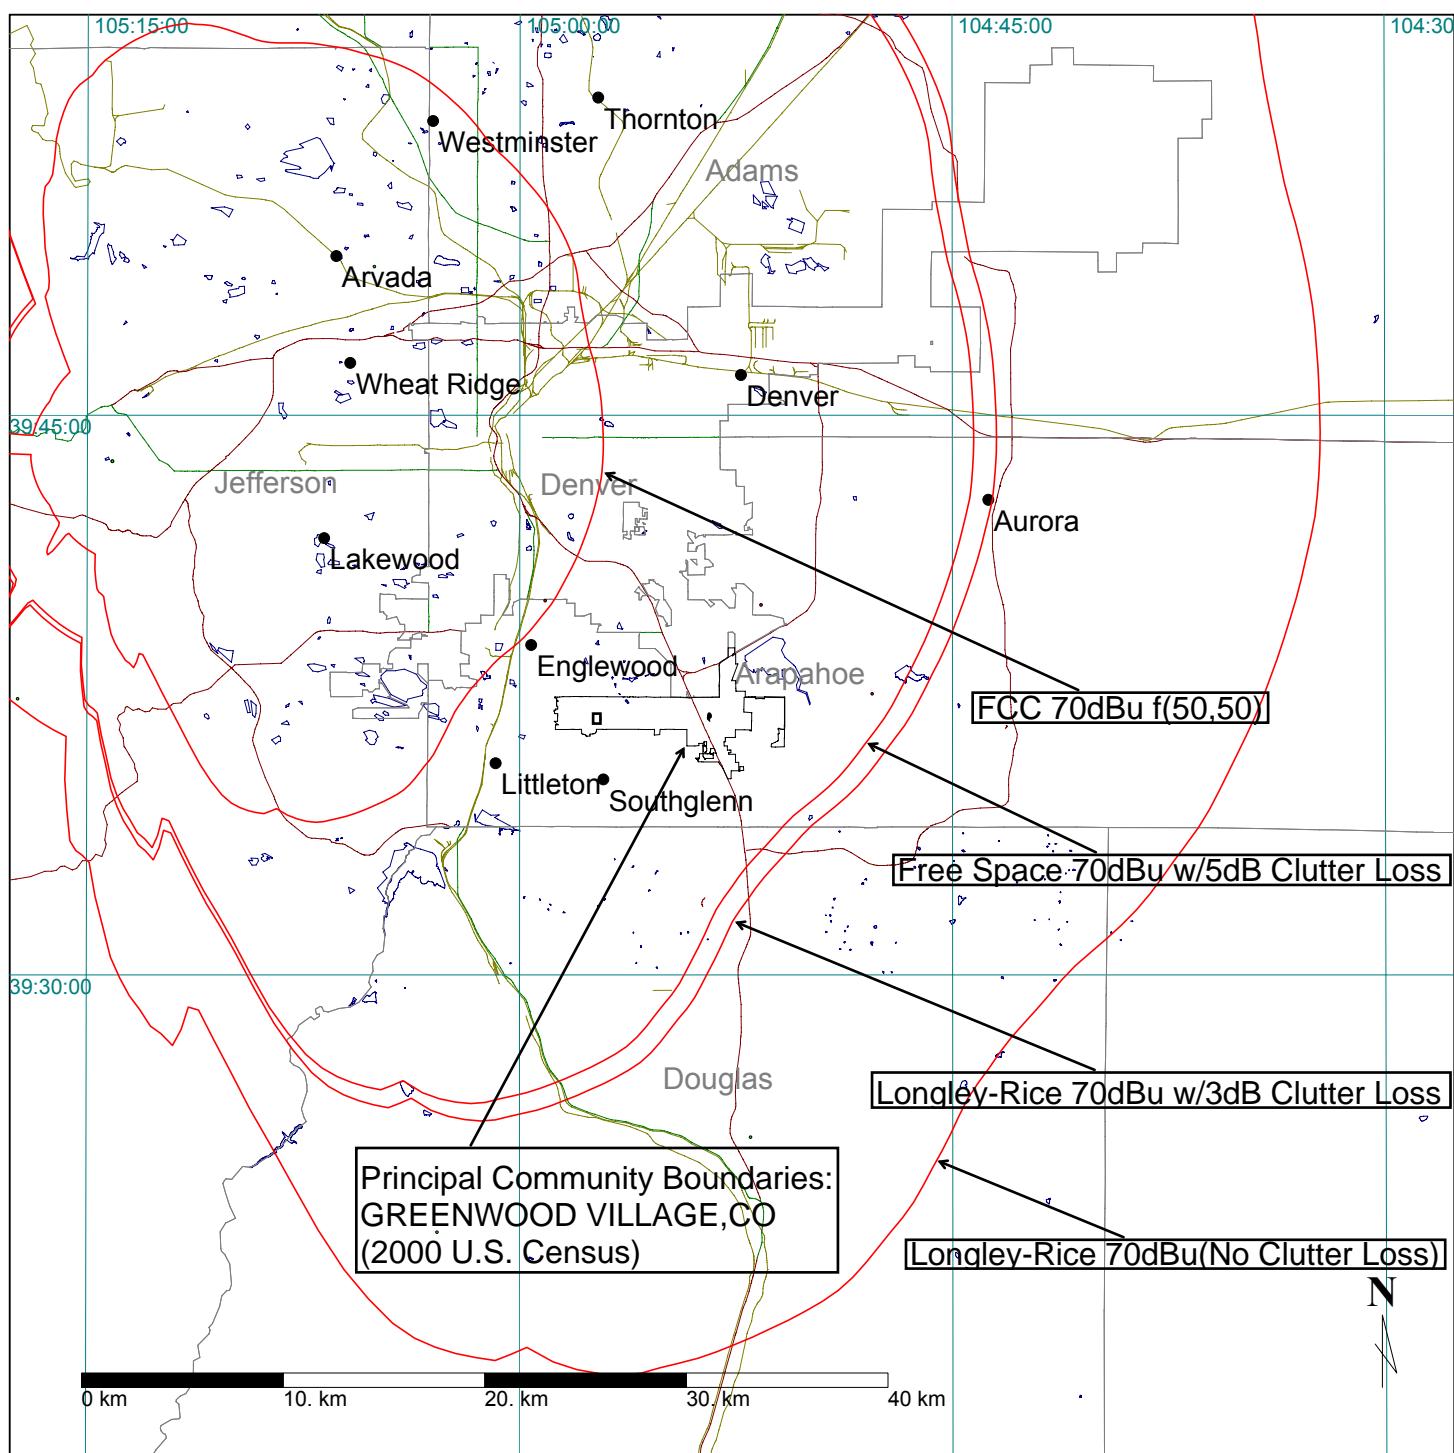

Terrain Database: DMA 3 Arc Second Digitized Terrain Datafile, Conus.

Contour Prediction Methods: FCC Standard f(50,50), 360 Radials , Free Space(NBS Tech Note 101), &amp; Longley-Rice

Comments: Longley-Rice Method predicts 74.41dBu at the center of the Principal Community, Greenwood Village, Colorado

Description: EXHIBIT E-4L 70dBu CONTOUR ANALYSIS with Alternate Prediction Methods

Date: 9/29/2006
