

## **EXHIBIT 22**

### **RADIOFREQUENCY IMPACT AND OCCUPATIONAL SAFETY**

OET Bulletin 65, Rev. 97-01 dated August 1997, establishes the 6-minute time averaging limit for maximum permissible exposure (MPE) for the proposed frequency (90.3 MHz) at 1 mW/cm<sup>2</sup> for Occupational/Controlled exposure, and at 0.2 mW/cm<sup>2</sup> for General Population/Uncontrolled exposure.

There are two FM Broadcast radio station antennas located on two different antenna supporting structures at the proposed site (KMRO 212B and KCPB 216B). As a result the simple RF Worksheet approach for this site is not appropriate. However, the applicant evaluated the existing transmitting facility on December 19, 1997, and determined in an on-site field survey that the site did not have a significant environmental impact as defined by 47 C.F.R. 1.1307 with regards to both occupational and public exposure.

After installation of the proposed transmitting equipment and antenna another field survey will be taken to ensure continued compliance with all applicable rules and guidelines. In addition, the applicant will cooperate with KCPB and other tenants at the site to reduce power or cease transmitting as required to protect the public and workers.

In light of the foregoing the proposed facility should be categorically excluded from RF environmental processing under Section 1.307(b) of the Commission's rules.
