CIRCULARLY POLARIZED DIRECTIONAL ANTENNA SYSTEM
PROPOSED FOR RADIO STATION WXKR
LOCATED IN PORT CLINTON, OH

Electronics Research Inc. proposes to provide a custom fabricated directional antenna system that is specially designed to meet the F.C.C. requirements and the general needs of radio station WXKR.

The antenna is the Harris Corporation FML-6E-0A-HW configuration. The proposed circular polarized system consists of 6 half-wavelength spaced bays using one driven circular polarized radiating element per bay, 1 horizontal parasitic element per bay and 5 vertical parasitic elements interleaved between alternate bay pairs. The antenna was tested on a 14" o.d. pole, which is the structure the station plans to use to support the proposed array. All tests were performed on a frequency of 94.5 megahertz which is the center of the FM broadcast channel assigned to WXKR.

Pattern measurements were made on a fifty-acre antenna pattern range which is owned and operated by Electronics Research, Inc. The tests were performed under the direction of Thomas B. Silliman, president of Electronics Research, Inc. Mr. Silliman has both the Bachelor of Electrical Engineering and the Master of Electrical Engineering degrees from Cornell University, and is also a registered professional engineer in the states of Indiana, Maryland and Minnesota.

DESCRIPTION OF THE TEST PROCEDURE

The test antenna consisted of two bay levels of the circular polarized system with the associated horizontal and vertical parasitic elements. The elements and brackets that were used in this test are electrically equivalent to those that will be supplied with the proposed antenna. Sections of 1 5/8 inch o.d. rigid coaxial line were used to feed the test antenna, and sections of 1 5/8 inch o.d. rigid outer conductor only were attached above the test antenna. All feed lines were over one half-wave in length. The lines were properly grounded during all tests.

The proof-of-performance was accomplished using a supporting structure of identical dimensions and configuration as the proposed 14" o.d. pole, including all braces, ladders, conduits,

coaxial lines and other appurtenances that are included in the actual aperture at which the proposed antenna will be installed. The 14" o.d. pole was erected vertically on a turntable mounted on a non-metallic building with the antenna centered vertically on the structure, making the center of radiation of the test approximately 25 feet above ground. The turntable is equipped with a motor drive and azimuth indicating mechanism, resolution of this azimuth measuring system is one-tenth of a degree.

The antenna under test was operated in the transmitting mode and fed from a Wavetek Model 3000 signal generator. The frequency of the signal source was set at 94.5Mhz and was constantly monitored by an Anritsu Model MLS21B measuring receiver.

A broad-band horizontal and vertical dipole system, located approximately 628 feet from the test antenna, and mounted at the same height above terrain as the center of the antenna under test, was used to receive the emitted test signals. The signals received by the dipole system were fed to test building by way of two buried Heliax cables to an Anritsu Model MLS21B measuring receiver. This data was interfaced to a Hewlett-Packard Model 9872C plotter by means of a Hewlett-Packard Model 86 computer system. Relative field strength was plotted as a function of azimuth.

The measurements were performed by rotating the test antenna in a counter-clockwise direction and plotting the received signal on polar co-ordinated graph paper in a clockwise direction. Both horizontal and vertical components were recorded separately.

CONCLUSIONS

The proposed circular polarized system consists of 6 half-wavelength spaced bays using one driven circular polarized radiating element per bay, 1 horizontal parasitic element per bay and 5 vertical parasitic elements interleaved between alternate bay pairs. The power distribution and phase relationship will be fixed when the antenna is manufactured. Proper maintenance of the elements should be all that is required to maintain the pattern in adjustment.

CIRCULARLY POLARIZED DIRECTIONAL ANTENNA SYSTEM
PROPOSED FOR RADIO STATION WKRR
LOCATED IN PORT CLINTON, OH

(Continued)

The FML-6E-DA-HW array is to be orientated on the 14" o.d. pole at a bearing of north 190 degrees east. Blue prints provided with the antenna will show the proper antenna orientation alignment. The antenna alignment procedure should be directed by a licensed surveyor as prescribed by the FCC.

Deicers are not supplied and are not available. The use of radomes is recommended if icing conditions will exist at the proposed site.

Figure #1 represents the maximum value of either the horizontal or vertical component at any azimuth. The measured horizontal plane relative field pattern, for both the horizontal and vertical polarization components, is shown on Figure #2 attached. A calculated vertical plane relative field pattern is shown on Figure #3 attached. The power in the maximum will reach 30 kilowatts (14.771 dBk).

The power at north 0 degrees east does not exceed 3.3 kilowatts (5.185 dbk).

The power at north 180 degrees east does not exceed 7.1 kilowatts (6.513 dbk).

The RMS of the vertically polarized horizontal plane component does not exceed the RMS of the horizontally polarized horizontal plane component.

The envelope pattern obtained from the maximum individual horizontal or vertical components will not exceed a rate of change of 2 DB per any ten degree change in azimuth as measured in the horizontal plane.

The approximate weight of the antenna minus the mounting structure is 595 lbs. The approximate windload of the antenna minus the mounting structure is 1145 lbs based on 50/33 PSF(112 MPH wind) with no ice build up. The clear vertical length of the structure required to support the antenna is 41 feet if the antenna is to be top mounted.

FEBRUARY 21, 1992

CIRCULARLY POLARIZED DIRECTIONAL ANTENNA SYSTEM
PROPOSED FOR RADIO STATION WXKR
LOCATED IN PORT CLINTON, OH

(Continued).

The directional antenna should not be mounted on the top of an antenna tower which includes a top-mounted platform larger than the cross-sectional area of the tower in the horizontal plane. No other obstructions other than those that are specified by the blue prints supplied with the antenna are to be mounted at the same tower level as the directional antenna. No obstruction of any type is to be within 75ft horizontally of the antenna system. The vertical distance to the nearest obstruction should be a minimum of 10ft from the directional antenna.

The calculated maximum power gain of the horizontal component is 4.0386 (6.0624dB).

The calculated maximum power gain of the vertically polarized component is 4.03864749945 (6.0624dB).

The calculated input power to the antenna input flange is 7.4282 kilowatts (8.7089 DBK) to provide a maximum horizontal ERF of 30 kilowatts (14.771 DBK) and a maximum vertical ERF of 30 kilowatts (14.771 DBK). The input flange to the antenna is 1 5/8 inch male.
