Technical Narrative

This technical exhibit supports a digital flash-cut application for television station WWXY-LP, File Number BLTTL-20080716AAS. WWXY-LP is licensed to operate on NTSC channel 38 with a directional antenna, effective radiated power (ERP) of 95.1 kW and an antenna height above mean sea level (RCAMSL) of 536 meters.

Station WWXY-LP is requesting authorization to digital flash-cut. It is proposed to operate from its present transmitter site using its existing antenna system, thus there will be overlap of the current 74 dBu and proposed 51 dBu contours as detailed below.

This application is considered a "minor change" in facilities pursuant to Section 73.3572, as it is a digital flash-cut application and the proposed 51 dBu contour will overlap a portion of the licensed 74 dBu contour (see Figure 1).

Proposed Facilities

Station WWXY proposes to operate on digital mode on channel 38 (614-620 MHz) from its existing transmitter site. An Andrew model ALP12L2-HSN antenna, shown in Appendix 1, will be employed with a maximum ERP of 2.91 kW and a RCAMSL of 536 meters. The antenna is mounted at the 36-meter level on the existing 56-meter tower that according to the TOWAIR study does not require registration.

Allocation Considerations

A post-transition interference study¹ has been conducted to assure that the proposal will not create prohibited interference with other licensed, authorized or pending analog or digital TV, LPTV/translator and Class A TV stations. The results of the study are shown in Figure 2.

Using the procedures outlined in the FCC's OET-69 Bulletin, a cell size of 1 kilometer, a distance increment of 0.5 kilometer and a full service out-of-channel emission mask filter, no prohibitive interference is predicted to any other station. If necessary, a waiver of the FCC rules, including Section 74.793 and 74.794, is respectfully requested for the use of the full service mask filter. Grant of the requested waivers is in the public interest, as the potential for first adjacent interference will be reduced.

The proposed operation, with no change in site, frequency of operation or antenna system, but with a significantly reduction in ERP, will actually lower radiation towards the National Astronomy and Ionosphere Center in Arecibo. The proposed facilities will provide the necessary protection to radio astronomy installations and FCC monitoring stations.

Radiofrequency Electromagnetic Field Exposure

The proposed WWXY facilities were evaluated in terms of potential radio frequency (RF) energy exposure at ground level to workers and the general public. The radiation center for the antenna is located 36 meters above ground level and the proposed ERP is 2.91 kW average. Assuming an antenna worst-case field factor of 0.3 for any depression angle greater than 5 degrees below horizon (see Appendix 1), the highest RF exposure that can be expected at a point 2 meters above ground level

¹ The du Treil, Lundin & Rackley, Inc. TV interference analysis program is based on the program and procedures outlined by the FCC in the Sixth Report and Order; subsequent Memorandum Opinion and Order; and FCC OET Bulletin No. 69. A nominal grid size resolution of 1 km and a distance increment of 0.5 km were employed. An Alpha based processor computer system was employed. The results have been found to be in very close agreement with the results of the FCC implementation of OET Bulletin No. 69.

corresponds to a power density of 7.6 uW/cm². This is 1.84% of the FCC's recommended limit of 411.3 uW/cm² for channel 38 for an "uncontrolled" environment, and thus in compliance with FCC rules.

Access to the transmitting site will be restricted and appropriately marked with warning signs. In the event that workers or other authorized personnel enter restricted areas or climb the tower, appropriate measures will be taken to assure worker safety with respect to radio frequency radiation exposure. Such measures include reducing the average exposure by spreading out the work over a longer period of time, wearing "accepted" RFR protective clothing and/or RFR exposure monitors or scheduling work when the stations are at reduced power or shut down.

It is noted that this statement only addresses the potential for radiofrequency electromagnetic field exposure. All other aspects of the environmental processing analysis should have been provided to the FCC by the existing tower owner.
