

TECHNICAL EXHIBIT
APPLICATION FOR WEST ORANGE AUXILIARY STATION
TELEVISION STATION WPXN-DT (FACILITY ID 73356)
NEW YORK, NEW YORK
CH 30 725 KW (MAX-DA) 223 M

Technical Narrative

The technical exhibit of which this narrative is part was prepared on behalf of television station WPXN-DT assigned to New York, New York in support of an application for a new digital auxiliary facility. The WPXN-DT main facility is the presently authorized facility located at the former World Trade Center (FCC File Number: BPCDT-19991028ACH). This proposed auxiliary facility will be located at the *West Orange* tower.

Transmitter Location

The herein proposed auxiliary facility will utilize a Dielectric TUD-C5SP-10/34U-2-B antenna mounted on an existing tower. The proposed antenna is located at the 98.5 meter (323 foot) level (see Figure 1). The Appendix contains the manufacturer's directional antenna information.

Coverage Contours

The predicted 41 dBu noise-limited coverage contours for the auxiliary operation and the authorized main operation were calculated in accordance with the provisions of Section 73.313. In accordance with current FCC practice, the distances to the contours were calculated without consideration given to terrain roughness correction factors.

The average terrain elevations from 3 to 16 kilometers along eight radials evenly spaced at 45 degree intervals were obtained from the National Geophysical Data Center's (NGDC) 30-second terrain database. The terrain elevations were then used in combination with the effective radiated power for determining the distances to coverage contours.

Figure 2 is a map showing the predicted 41 dBu coverage contours for the authorized man and proposed auxiliary operations. As the map illustrates, the predicted auxiliary's 41-dBu contour is entirely encompassed by the primary station's 41-dBu contour.

Radiofrequency Electromagnetic Field Exposure

The proposed facility has been evaluated in terms of potential radiofrequency electromagnetic fields at ground level in accordance with OET Bulletin No. 65, Evaluating Compliance with FCC Specified Guidelines for Human Exposure to Radiofrequency Electromagnetic Fields. The proposed calculated power density at the base of the tower was calculated using the appropriate equation contained on page 30 in Supplement A, Additional Information for Radio and Television Broadcast Stations, of the Bulletin.

For the calculation, a downward relative field value of 0.2 was assumed for the transmitting antenna. Therefore, using a maximum average effective radiated power of 725 kilowatts and a relative field value of 0.2, the predicted power density at ground level located 98.5 meters (323 feet) below the antenna radiation center is 0.10 mW/cm^2 . This is 26% percent of the Commission's guideline in an uncontrolled environment for a Channel 30 television station. WPXN-DT would be the only authorized facility at this site.

Consulting Engineers
Page 3
New York, New York

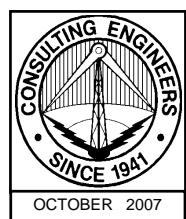

Access to the transmitting site is restricted and appropriately marked with warning signs. When it becomes necessary for workers to ascend the tower, appropriate measures, such as reduction or shutdown of power if necessary, shall be taken to ensure that the human exposure to radiofrequency electromagnetic fields will not exceed the FCC guidelines.
