

**Explanation of Construction Permit Modification
W42DJ-D Channel 42 – Ocala, FL
December 2, 2011**

W42DJ-D currently holds construction permit BPD TT-20110622AAO. It has now become necessary to modify the antenna specified in that permit. Due to the difference in the antenna pattern and gain, the effective radiated power is being reduced from 8.03 kW to 7.1 kW. An OET-69 study has been performed and confirms that the proposed change will not cause any impermissible interference. Since there is no change in the site location the area served by the station will remain similar to the facility contained in the current permit.

In that the power has been reduced and there will be no change in the antenna height, there will be no increase in the RF exposure level that was previously determined to be within acceptable limits..
