Exhibit 10C -- Proposed Transmit Antenna Description

The proposed transmit antenna will consist of a vertically-stacked array of two Kathrein/Scala model CL-FM log-periodic antennas centered at 100 meters above ground level on the southeast leg of the tower, oriented at azimuths of 80 and 190 degrees true, and fed in phase through a "50/50 percent" power divider. The radiating elements of each CL-FM assembly will be slanted 45 degrees from the horizon to emit equal power in the horizontal and vertical polarizations at the center of each major lobe.

The attached plots and tabulations show that the calculated relative field of a horizontally-polarized CL-FM array with similar azimuth orientation does not exceed that of a vertically-polarized CL-FM array at any bearing. The vertically-polarized values have been entered in the Form 349 tech box.

Antenna: CL-FM array - 110 degree skew at 80 and 190 degrees True
 Frequency: 100.7 MHz Polarization: Horizontal
