December 1, 2017

Mr. Perry-

I am writing to follow up on our discussions regarding WPMZ's directional array as it relates to the installation of W235CN.

WPMZ has been operating under a low power STA ( BSTA-20150408ACV ) for some time now due to equipment damage caused by leaks in its transmitter building. The landlord decided it would not repair the existing structure, and instead provided a new transmitter building for WPMZ. The STA in question was modified earlier this year to allow operation with parameters at variance, and nondirectional operation to accommodate this move.

WPMZ recently finished moving all of the AM broadcast equipment out of the old building, including the main transmitter, the phasor, and the transmission lines. During this process, additional equipment damage was sustained, and repair efforts have been ongoing now that WPMZ is in the new shelter.

Recently, WPMZ has been operating non-directionally to accommodate repairs and measurements on the directional antenna system after the move. As such, WPMZ was not operating directionally during the pre-construction period for W235CN and a partial proof could not be performed before construction. Once repairs to the main transmitter and the antenna system are complete, Radio Sharon shall perform a partial proof on WPMZ's array.

Regards,

Rachel Simon
