(Page 1 of 43)

SKYWAVE INTERFERENCE STUDY  
Sports Radio Chicago, LLC  
Chicago, IL

There are two Class A stations that lie within the arc of the proposed augmentation to the WMVP nighttime directional pattern. These stations are:

KOMO	Seattle, WA	1000 kHz
XEOY	Iztacalco, DF	1000 kHz

Table 16.0 presents the projection of the KOMO 0.5 mV/m, 50% nighttime skywave contour. Table 16.1 tabulates the KOMO 0.5 mV/m nighttime groundwave contour. This groundwave contour was projected using conductivity data extracted from FCC Figure M3. Table 16.2 lists the projection of the XEOY 0.5 mV/m, 50% nighttime skywave contour. Table 16.3 presents the projection of the XEOY 0.5 mV/m nighttime groundwave contour. The XEOY groundwave contour was projected using conductivity data extracted from the Region 2 Conductivity Map.

Table 16.4 presents the projection of the 0.025 mV/m, 10% skywave contour for the proposed modified WMVP nighttime facilities using domestic standards. Table 16.5 lists this same contour projected using the standards outlined in the 1992 bilateral broadcasting agreement between the United States and Mexico. Finally, Table 16.6 presents the projection of the 0.025 mV/m, 10% skywave contour for the presently licensed WMVP nighttime facilities using these same Mexican standards.

Figure 16.0 shows the 0.025 mV/m, 10% skywave contour for the proposed modified WMVP nighttime facilities in relation to the contours for KOMO. As can be seen from an examination of this figure, the modified WMVP nighttime facilities will provide the required skywave protection to KOMO. Figure 16.1 depicts the 0.025 mV/m, 10% skywave contours for the WMVP licensed nighttime facilities and the proposed modified

EXHIBIT 16  
(Page 2 of 43)

nighttime facilities in relation to the normally protected contours for XEOY. As shown by this figure, the skywave contour for the WMVP licensed facilities penetrates both the skywave and groundwave contours for XEOY. This figure also shows that the skywave contour for proposed modified facilities will be totally contained within the skywave contour for the licensed WMVP nighttime facilities. Based upon this information, the proposed modified WMVP nighttime facilities will provide the required skywave protection to XEOY.

Nighttime computer allocation studies were conducted for domestic Class B stations operating at night on 990 kHz through 1010 kHz and all other Region II Class B stations operating at night on 1000 kHz that lie within the arc of the proposed augmentation. The computer program calculates the distances and bearings between all stations operating on these channels using great circle calculation techniques. Appropriate curves from the FCC Rules and applicable international agreements were then used to compute the critical elevation angles and skywave field factors for determining the RSS limitation for each station. The parameters for the nighttime operation of each station were taken from the FCC's Consolidated Database System ("CDBS"). These parameters were then used by the computer to calculate the RSS limitation for each station. RSS limitations to and from domestic Class D stations were not included in these RSS calculations, since the nighttime operations of these stations are secondary and are afforded no interference protection. In addition, RSS limitations from foreign stations that are shown in the CDBS as being objected to by the United States were not included in the RSS calculations toward any station requiring consideration.

EXHIBIT 16  
(Page 3 of 43)

Tables 16.7 through 16.29 present the RSS limitation calculations to all stations operating on 990 kHz through 1010 kHz within the arc of the proposed augmentation that require protection consideration where the RSS contribution from the proposed modified WMVP nighttime facilities exceeds 0.1 mV/m. As can be seen from these tables, the licensed WMVP nighttime facilities enter the 25% exclusion RSS limitation to K TOK - Oklahoma City, Oklahoma which operates on 1000 kHz. This table also shows that the WMVP contribution to the K TOK RSS will be reduced by the proposed modified WMVP nighttime facilities.<sup>1</sup>

Finally, these tables also show that the proposed modified WMVP nighttime facilities will not enter the RSS limitation of any other station requiring nighttime protection consideration within the arc of the proposed augmentation.

---

<sup>1</sup>Although the K TOK 25% exclusion RSS will actually increase from 3.293 mV/m to 3.380 mV/m as a result of the WMVP modifications, this is an anomaly which results from the fact that CBW - Winnipeg, Manitoba, which does not enter the present K TOK 25% exclusion RSS limit, enters this RSS limit as a result of the reduction in WMVP's contribution. This should not be an obstacle to the grant of the attached application since the proposed modifications result in a reduction in WMVP's contribution to this RSS limit.
