

Exhibit 15

Contour Overlap Protection

The allocation situation for the proposed station is reported on the following pages. A complete explanation of how to read the printout is shown on the page after the tabulation. Summarizing the explanation, each group of lines represents an existing or proposed full service station. Entries which have a negative number in the columns marked *IN* or *OUT* could cause interference with the proposed station.

Only two of the stations listed in the printout has a negative value in the *IN* and *OUT* columns, indicating that a potential for interference occurs on the line directly between the proposed facility and those stations.

The proposed station has been exhaustively evaluated to certify the protection of each of the stations in the tabulation where the *IN* or *OUT* contour separation is less than 10 km (7 miles). In each case, a digitally generated map is provided showing the appropriate protected (black line) and interfering (red line) contours. In cases where the map is also inconclusive, the value of the interfering signal is tabulated along the protected contour. It is shown to not exceed the mandated value at any point on the protected contour. That tabulation is also appended to the exhibit in these cases. Since there is no point on the protected contour where the interfering signal strength exceeds the mandated value, no contour overlap exists, and no area of interference is predicted.

NCE Stations

The first station in the attached listing the proposed station, which is being modified, and therefore need not be protected.

The second station is an application for U Mass in Stow, MA. It is being dismissed as part of the resolution agreement.

The third station is an application by WAVM.A. This application is to be modified to the attached pattern by mutual agreement of the parties, and also increased from the CDBS value of 250 to 500 Watts. The site and height are unchanged. In each direction, the protected contour is 60 dBu and the interfering contour is 40 dBu because the proposed station and WAVM.A are both NCE stations and are on the same channel. The appended map is insufficient to certify the lack of prohibited contour overlap for the incoming contour overlap. The interfering contour of the WAVM.A is tabulated along the protected contour of the proposed station. At no point does it exceed the stipulated 40 dBu, showing that there is no area of prohibited contour overlap. The lack of outgoing contour overlap is also not apparent from the map. The interfering contour of the proposed station is tabulated along the protected contour of WICN. At no point does it exceed the stipulated 40 dBu, showing that there is no area of prohibited contour overlap.

Maps are sufficient to certify lack of prohibited contour overlap in most cases examined, but similar tabulations are provided when the maps are unclear.

IF Spacings

No IF related stations were found in the search.

TV6 Protection

TV channel 6 protection for WLNE is studied in Exhibit 18. There are no other TV channel 6 stations within the 159 km reporting radius for channel 219, as shown in the tabulation.

Class Contour Distance

The allocation study also shows the class contour distance of the proposed station (the 9.42 km at the top of the page), when rounded to the nearest kilometer according to §73.211(b)(1) does not exceed the class A class maximum contour distance of 28 km (§73.211(b)), but does exceed the class A minimum contour distance of 6 km.

Summary

This allocation study shows that no interference to any existing or proposed station will be produced by granting the proposed station.

ERP and HAAT are on direct line to and from reference station.

• affixed to TV6 Margin= no direct-line contour overlap.

"*"affixed to 'IN' or 'Out' values = site inside protected contour. "<" = contour overlap

HOW TO READ THE FM COMPUTER PRINT-OUT

The computer print-out should be self-explanatory for the most part. The parameters of the station being checked, (reference station) are printed in the heading. The 60 dBu protected contour is predicted from the Commission's F(50-50) table, while the 40, 54, 80 and 100 dBu contours are interference contours derived from the Commission's F(50-10) table. Contour distances are in kilometers and are predicted using spline interpolation from data points identical to those published in Report No. RS 76-01 by Gary C. Kalagian. Critical contour distances are determined using the Commission's TVFMINT FORTRAN subroutine. When interference contour distances are less than 16 kilometers the F(50-50) tables are used. If signal contour distances are less than 1.6 km the free-space equation is used.

The column listed "* IN *" is the sum of the reference station's 60 dBu protected contour and the data file station's interference contour subtracted from the distance between the stations. (All distances are derived by the method detailed in Sec. 73.208 of the Rules and Regulations as amended in Docket 80-90.) Therefore, the column is a measure of incoming interference. Negative distances in this column indicate the presence of interference. Listed antenna heights are the average heights of eight standard radials as found in the Commission's records unless otherwise noted, in which case the specific antenna heights along the azimuths between the reference station and the database station are used and visa versa. The column labeled "* OUT *" shows the distance of kilometers of overlap or clearance between the reference station's interference contour and the database station's protected contour. Negative distance figures in this column indicate outgoing interference.

For I.F., commercial, international and other spacing based relationships, the "IN" and "OUT" columns change their significance. The letter "R" stands for the minimum required distance in kilometers, while the letter "M" in the next column follows the available clear space separation in kilometers or "Margin". Minimum commercial separation distances were taken from Sec 73.207 of the rules as amended. This procedure is also used for all Canadian and Mexican spacing. Canadian separation distances were derived from the "Canadian/American Working Agreement".

Under the "BEARING" column, the first row of numbers indicate the bearings from true north of the data base stations in relationship with the reference station, while the numbers in the second row indicate the reverse bearings from the database station to the reference station.

The columns labeled "INT" and "PRO" hold the distance in kilometers of the appropriate interference contour and the protected contour of a data base station.

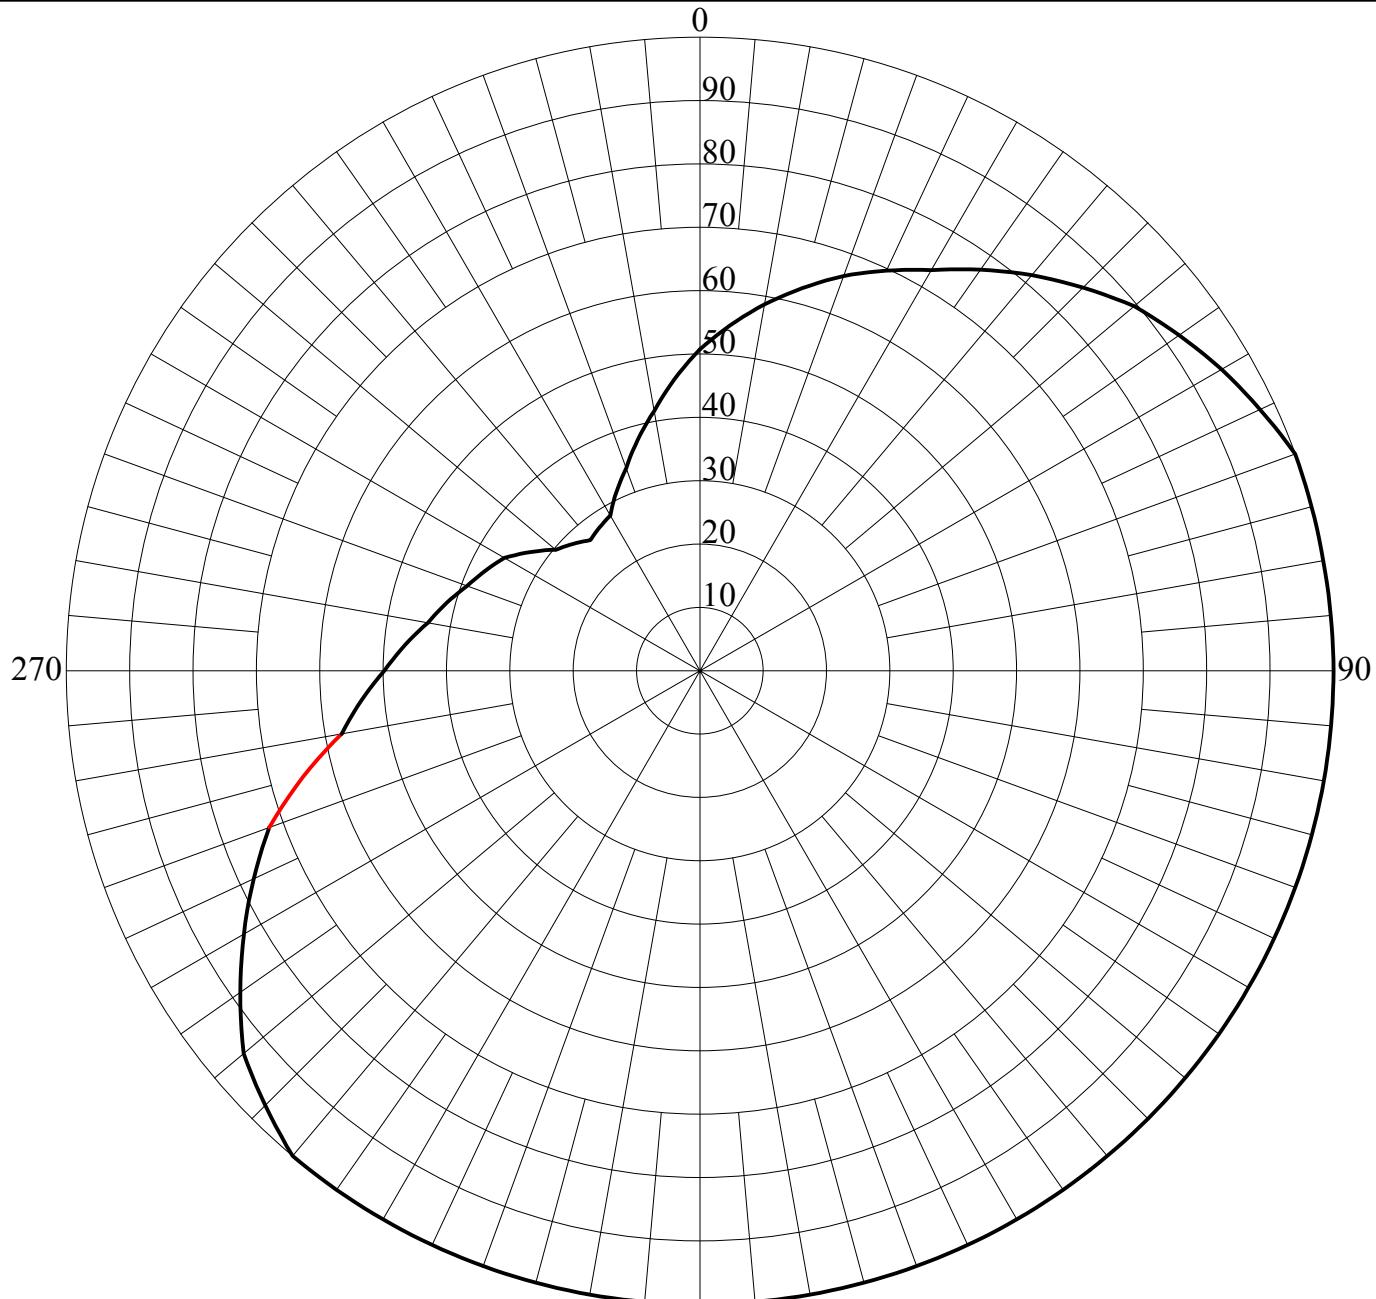

The first three letters of the "TYPE" column identify the current F.C.C. status of the stations. The fourth letter will be a "D" or "Z" (Sec. 73.215) if the facility is directional. The fifth letter will be an E, H or V depending on the type of antenna polarization. The sixth letter will be a 'Y' if the antenna uses beam tilt.
