

Exhibit E-22

The proposed facility would not constitute a significant environmental impact, and should be exempt from environmental processing. The proposed facility would be located at an existing structure that is registered with the Commission. The site that would be utilized by the proposed facility is the same structure currently utilized by the licensed KAYH facility.

The proposed facility will not constitute an RF exposure hazard to persons at the site. The Commission's FM Model software package predicts a maximum power density at ground level of $60.2 \mu\text{W}/\text{cm}^2$ at a distance of 12 meters from the base of the tower. This predicted power density is less than the uncontrolled environment upper limit of $200 \mu\text{W}/\text{cm}^2$. There are no other broadcast facilities on the tower. This calculation is based on the assumption that a 6-bay ERI style antenna would be utilized.

The applicant certifies that it will coordinate with all present and future users of the site to protect workers having access to the site from being exposed to levels of radiofrequency radiation which may exceed applicable guidelines. Such coordination will include, but is not necessarily limited to, a reduction in power and/or cessation of operation as necessary.
