COMPREHENSIVE TECHNICAL EXHIBIT

Application for Flashcut Construction Permit
K20CP, Facility ID 58665
FCC File Number BLTT-19911029JI
SALISH KOOTENAI COLLEGE

Application for Flashcut, Minor Change. The within filing seeks a change of operating mode from NTSC to digital via the flashcut mechanism. Further, a small move to an improved tower site is included in the application. The service contour from the proposed site is contained within that from the presently licensed site. The same community is served.

Use of unregistered tower. The tower specified in the within application is an unregistered 15 meter tall tower. The tower planned for this application has been subjected to TOWAIR and that study reveals that registration is not required as the analysis shows that no airports are located within 8 km.

Interference Analysis. Following an OET 69 Longley-Rice study exhibit for the above-captioned application on channel 46 as performed by the Techware, Inc. FCC interference analysis program using a Sun Blade computer, the within application is found to fully comply with §74.793. Accordingly, the within application is grantable.

Canadian Border Area application. This application is within 320 km of the U.S. border with Canada. Additionally, the 19 dBu F50,10 interference contour encroaches into Canadian territory. However, this facility has been previously coordinated with the Canadian Government on this channel and the instant application interference contour is fully contained within and at no point extends beyond the previously coordinated contour. Thus, this application should not need to be sent to the Canadian authorities.
