

Radio Station WSNR • 620 kHz, Class B • Jersey City, New Jersey

Skywave Interference Protection FCC Form 301 §III-A, Question 10.b.

The proposed facility meets all FCC Rules pertaining to skywave protection of all existing stations, permits, and applications, as summarized below.

RSS Calculations

The proposed facility enters into the 25% RSS of four stations (WHEN, WPRO, WVMT, and WZON), but its contributions do not increase over those now authorized, as shown in the following Exhibit 15B.

Per FCC policy, Cuban and Dominican Republic Stations were not included in RSS calculation to US stations but were included in RSS calculations to foreign stations.

As shown in the table below, two stations make up the 50% RSS of the proposed facility, giving an Interference-Free contour level of 19.72 mV/m:

To WSNR 620 kHz proposed

From	Freq	Dist	Bear	GM	Tmin	Tmax	Skywv	Thet	Rmax	Limit	RSS
WHEN	620	310	144.2	53.4	24.2	36.9	0.1902	24.2	370.4	14.09	14.09

“Clipping” Study

RSS calculations have been performed at 1° increments along the Nighttime Interference-Free (NIF) contours of all stations entitled to protection, and the proposed facility provides the required protections for all points over land. Measured soil data was used, where available, to project the NIF contour of affected stations (see Exhibit 14F).

Skywave Study

There are no co-channel or first-adjacent Class A stations for which skywave contour protection is required.

Radio Station WSNR • 620 kHz, Class B • Jersey City, New Jersey

Skywave Interference Protection

Following are definitions for column heading abbreviations used in the tables:

Freq	is frequency in kilohertz.
Dist	is distance, in kilometers.
Bear	is azimuth, in degrees east from true north.
GM	is geomagnetic latitude of path midpoint, in degrees.
Tmin	is lower pertinent departure angle, in degrees.
Tmax	is higher pertinent departure angle, in degrees.
Skywv	is the 10% skywave signal for 100 mV/m radiated at 1 km, in mV/m.
Thet	is the departure angle between Tmin and Tmax where the radiation is greatest, in degrees. Note: for interference to Canada and Mexico, Thet = Tmin = Tmax departure angle (1) of Section 73.190, Figure 6a.
Rmax	is the radiation at departure angle Thet, in mV/m at 1 km.
Limit	is 20 times the skywave field at the receive point for co-channel stations and 2 times the skywave field for first adjacent stations, in mV/m.
RSS	is the square root of the sum of the squares of the limits, using the 50% and 25% exclusion rules, in mV/m.
