RE: Report of antenna alignment
At South Mountain

ATTN: Doug Fisher

This is to report to you the result of our survey crew's inspection of the alignment of the antenna at the tower on South Mountain. On October 2, 2012 we set a hub and tack on the ground along the 229° Azimuth (True) from the tower leg the antenna was to be attached to.

The crew set their instrument over that hub and sighted the antenna this morning. Using the best available observation method, the report is that the antenna appears to point at that hub along the Azimuth line from that tower leg.

Respectfully submitted,

Gareth M. Johnson, PLS
