

Statement about Antenna Structure Registration

We believe an ASR is not needed in this case. A study of the antenna structure for this translator using the TOWAIR tool shows that a registration is not necessary. The applicant is proposing to mount the antenna at the top of an existing grain silo at 53 meters above ground level. The antenna will be even with the top of the silo, extending out horizontally from the top on a pipe. The fact that it's on a silo causes the TOWAIR to show that it passes because of the 20 feet diameter rule. Because of this, in past versions of this application as well as this time, we have checked not applicable with regard to the ASR.
