

Directional FM Antenna**WDWZ****B. Jordan Communications Corporation
Andalusia, AL**

A modified PSIFML antenna model with parasitic elements was used in conjunction with the customer's Rohn 25 triangular tower to create the necessary directional radiation pattern. The final antenna consists of one radiating element secured to a PSI supplied support mast mounted to the northeast tower face and one horizontal parasitic element.

Pattern testing was performed using a 1/3 scale model element and tower. The azimuth plane measurements were taken on a ground reflection test range. This type of test range utilizes the reflected signal and direct signal from the source antenna to form an interference pattern on the antenna under test. The antenna and tower under test was mounted to a turntable that allowed the structure to be rotated 360° in the azimuth plane. The source antenna was located approximately 75 ft. from the antenna under test. The source height above ground was adjusted to peak the first lobe of the interference pattern at the antenna under test.

The test antenna was mounted in the center of rotation of the turntable. The antenna and tower were rotated clockwise while data was recorded in a counter clockwise direction. All feed cables to the antenna were secured and grounded during pattern measurements. A Hewlett Packard 8753E-network analyzer operating at 267.9 MHz was used as both the source and receiver. The level of the received signal was compared with a standard dipole to establish the directivity of the final pattern. The final pattern measured does not exceed the envelope pattern and is 87.2% of the envelope RMS.

The antenna and mast assembly is to be mounted 75.9 meters (249 ft) +2/-4 meters above ground level on a the northeast tower face and positioned 35° True. No other antenna can be installed on the mast or within 10 ft. of the radiating element. It is recommended that a broadcast engineer be present to supervise the installation of the antenna and that he or she certifies that the antenna has been installed according to the enclosed instructions.

An input power level of 1.24 kW will be required at the antenna input in order to reach the approved 1.4 kW ERP. The transmitter output power requirements are dependent upon the transmission line size and length used to feed the antenna.

Antenna Specifications

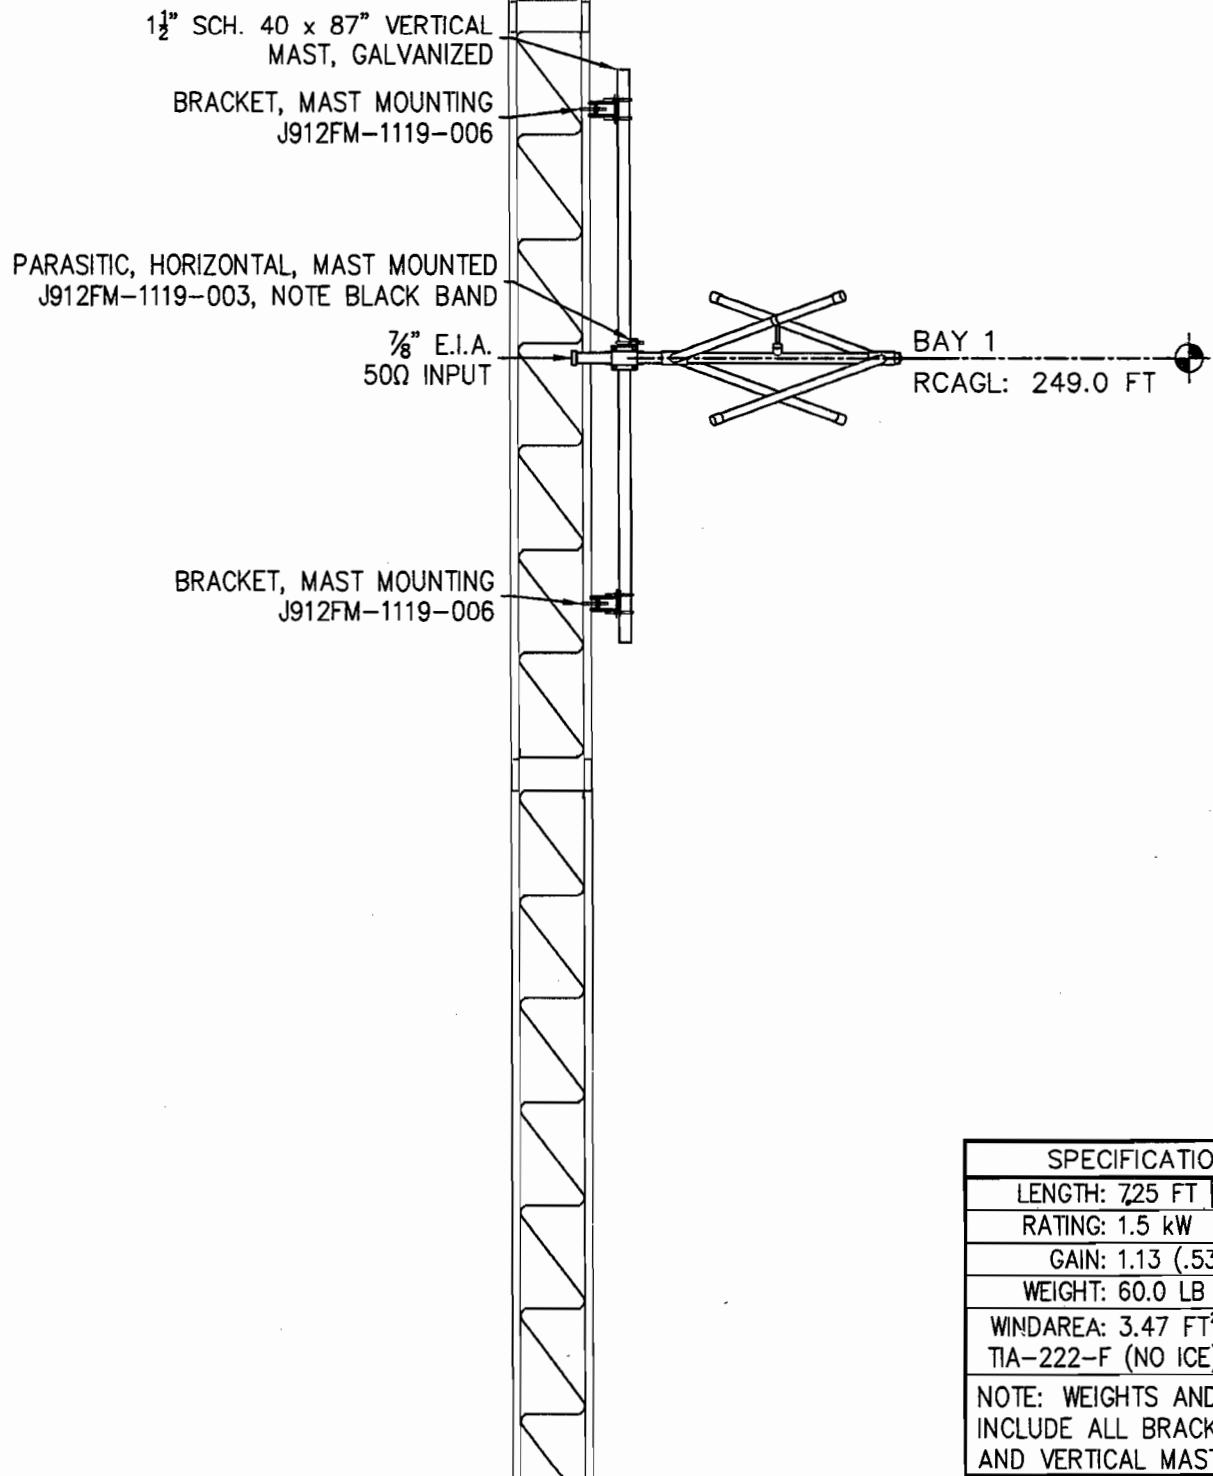

| | |
|---------------------|------------------------------|
| Antenna Model | PSIFML-1B-DA |
| Type | 1-bay directional FM antenna |
| Frequency | 89.3 MHz |
| Polarization | Circular |
| Envelope RMS | .782 |
| Composite RMS | .682 |
| Gain (h-pol) | 1.13 (.53 dB) |
| Gain (v-pol) | .811 (-.91 dB) |
| ERP | 1.4 kW |
| Antenna input power | 1.24 kW |
| Antenna Input | 7/8" EIA |
| Power rating | 1500 watts |
| Length | 7.25 ft. |
| Weight | 60 lbs. |
| Wind Area | 3.47 sq. ft. |

Statement of Certification

This is to certify the antenna has been designed, fabricated and tested under my supervision and it meets the required envelope pattern limitations set forth in the stations construction permit.

 11/9/12
