

EXHIBIT 36

KECI-TV, Missoula, Montana

KECI-TV, Missoula, Montana (the “Station”) respectfully submits this request for extension of the Special Temporary Authority (“STA”) authorized in FCC File No. BDSTA-20090812AAY. The STA authorizes the Station to operate with an effective radiated power (“ERP”) of 41.3 kW.

The Station requested the STA to operate with this ERP because, following its transition to final digital operations on VHF channel 13, it received approximately 350 calls and 100 e-mails from over-the-air viewers who had previously been able to receive the Station’s pre-transition digital signal (on UHF channel 40) but were no longer able to receive the signal. Since the Station increased its power to 41.3 kW ERP, pursuant to the STA, its viewers have experienced significantly improved reception. Indeed, following the power increase, the Station has received no calls from viewers experiencing difficulty in receiving the Station’s digital signal. In addition, Station personnel have reached out to many of the viewers who contacted the Station immediately after its transition to final digital operations on VHF channel 13, including by making household visits to test signal strength, and have confirmed that the power increase appears to have resolved the reception problem for the vast majority of these viewers.

Pursuant to the terms of the STA, and in support of its extension request, the Station hereby submits a report detailing field strength measurements taken before and after the requested power increase was implemented. This report shows that the power increase appears to have substantially resolved the reception problems previously identified, with increased signal levels observed at 13 of 16 measurement locations, and therefore establishes that extension of the STA would serve the public interest.
