

Technical Statement
Application for Construction Permit
W279AJ 103.7 mHz. Highland, NY
January, 2014

This technical statement is prepared by Charles Williamson, president of Digital Radio Engineering, Inc., for Walker Broadcasting Company, Inc., licensee of W279AJ at Highland, NY. This application serves three purposes: (1) Specify a different antenna at the same elevation on the same tower structure, (2) specify a different power level and (4) specify a different primary station.

The Translator Station will operate at 250 watts with a directional antenna. The 60 dBu service contour of the licensed translator facility is entirely within the service contour of the proposed translator facility. Also, it should be noted that the primary station, WFGB, is a Class B and the proposed translator 54 dBu service contour is completely within the 54 dBu contour of the proposed primary station, and is therefore considered a fill-in translator facility. Please see the contour maps at Exhibit 12 which detail the locations of the contours.
