

EXHIBIT 12
Page #1, Waiver Request of Section 74.1204
Summerfield, NC New-T 13 Watts ERP
Calvary Chapel of Twin Falls, Inc. 7/03

The proposed site is contained entirely inside the service contour of second and third-adjacent Stations WGBT, Eden, NC and WHPE, High Point, SC

WGBT

The proposed site is contained entirely inside the service contour of third-adjacent Station WGBT, Channel 233, Class C1, 100kW, Eden, NC. As shown by the map on **page #2** of this waiver request, the level of the third-adjacent station WGBT least arriving protected F(50,50) signal at the proposed transmitter site is 92-dBu. Using the Undesired-to-Desired method for calculating proposed interference (the basis of the FCC current contour overlap regulations and an acceptable method for the purposes of determining lack of interference for an FM Translator), the proposed interfering contour with respect to WGBT is 132-dBu (free-space contour method employed). This means that the 132-dBu interfering signal would, in the worst case at the maximum radial, extend 6 meters from the Center of Radiation, which is proposed at 110 meters AGL. This interfering contour does not touch the ground. The interference contour of 6 meters begins at 104 meters above ground level. The tower is not located on top of a building and is not located in a highly populated area and there are no adjacent buildings that exist at the height of 104 meters within 6 meters of this tower. Since no population inhabits this 132-dBu interfering areas, Calvary Chapel of Twin Falls, Inc. respectfully requests a waiver of the FM translator contour overlap regulations with respect to third-adjacent channel station WGBT.

WHPE

The proposed site is contained entirely inside the service contour of second-adjacent Station WHPE, Channel 238, Class C1, 100kW, High Point, NC. As shown by the map on **page #2** of this waiver request, the level of the second-adjacent station WHPE least arriving protected F(50,50) signal at the proposed transmitter site is 70-dBu. Using the Undesired-to-Desired method for calculating proposed interference (the basis of the FCC current contour overlap regulations and an acceptable method for the purposes of determining lack of interference for an FM Translator), the proposed interfering contour with respect to WHPE is 132-dBu (free-space contour method employed). This means that the 110-dBu interfering signal would, in the worst case at the maximum radial, extend 81 meters from the Center of Radiation, which is proposed at 110 meters AGL. This interfering contour does not touch the ground. The interference contour of 81 meters begins at 29 meters above ground level. The tower is not located on top of a building and is not located in a highly populated area and there are no adjacent buildings that exist at the height of 29 meters within 81 meters of this tower. Since no population inhabits this 110-dBu interfering areas, Calvary Chapel of Twin Falls, Inc. respectfully requests a waiver of the FM translator contour overlap regulations with respect to second-adjacent channel station WHPE.
