

ENGINEERING STATEMENT – SECOND ADJACENT CHANNEL PROTECTION

KLTN, Houston, TX, 275C0 (68.2 kilometers at 178 degrees True from LPFM site) and KMJQ, Houston, TX, 271C (89.2 kilometers at 188 degrees True from LPFM site) are second adjacent-channel stations to the proposed channel 273 LPFM facility. (Note that the 60 dBu F50,50 Contour of KMJQ does extend to the LPFM site and falls short of the LPFM site by at least one kilometer. *KMJQ is adequately protected.*)

The protected service contour of KLTN extends beyond the LPFM transmitter site. Using the well-established *Living Way Ministries* Methodology, no actual interference to any population is predicted to exist to KLTN.

Note that a rule waiver of Section 73.807 for this second adjacent-channel protection using the well-established *Living Way Ministries* Methodology is respectfully requested if such a rule waiver is deemed necessary for protection to this station.

The F50,50 signal strength from KLTN at the proposed LPFM transmitter site is 61.6 dBu (the “desired” signal for KLTN). The second/third adjacent-channel protection is an undesired-to-desired (“U/D”) dB signal strength ratio of 40:1. Therefore, predicted interference to KLTN and is a LPFM signal of greater than or equal to 101.6 dBu.

Figure EE1 is the vertical plane relative field pattern for the proposed antenna. By adjusting for the vertical plane downward relative field values of the proposed antenna, it is herein demonstrated that the 101.6 dBu interfering signal (using a free space field determination) does not exist at any point a ground level. (Actually, the study is made to 2 meters above ground level to account for a person’s height.)

Attached as Figure EE2 is a tabulation of various points (at 2 meters above ground level) from the proposed translator tower base. (Column B is the different distances from the tower base to each studied point.) The actual distance from the antenna to each point is listed in Column C, the hypotenuse of the vertical height (Column A) and the horizontal distance (Column B). Because the calculated distance to the free space interfering signal (Column J) is less than the hypotenuse distance (Column C) for each studied point, the interfering signal does not reach any studied point. (In other words, the interfering signal does not make it to 2 meters above ground level to any point.) Therefore, pursuant to Section 74.1204(d) of the FCC Rules, KLTN is adequately protected by the proposed facility.

The above study results of Figure EE2 assume uniform terrain elevation near the proposed tower. Because the clearance shown (Column C minus Column J values) is at least 60 meters for all rows, this assumption is acceptable for showing non-interference—no actual elevation within 250 meters of the proposed translator tower is at an elevation that is more than 10 meters above that of the tower base elevation.

AERIAL PHOTO

Attached is an aerial photo of the proposed transmitter site. All nearby buildings shown on the photo are less than 20 meters in height; therefore, based on the clearance shown by Figure EE2, no interference is predicted to occur to KLTN.

NOTE: Study point at 2 meters above ground level.

Worst-case relative field of 1.000 used for last examined point.

RESULTS: COLUMN J DISTANCES ARE LESS THAN COLUMN C DISTANCES IN ALL INSTANCES; THEREFORE, INTERFERRING SIGNAL DOES NOT EXIST AT ANY LOCATION (TWO METERS OR LESS ABOVE GROUND LEVEL)
