

Interference Analysis Exhibit

Page 1 of 11

Overlap Requirements

Page #3 of this exhibit is a computer generated channel study showing the relationship of the modified translator and adjacent stations. Page #4 is an explanation of the computer generated channel study. Pages #5-11 demonstrate the translator's compliance with respect to Canada.

According to 47 C.F.R. §74.1204(a), translators, such as the one being modified herein, are required to protect all existing FM stations from interference due to overlap of their protected contour with the interfering contour of the new station. On page #3 the numbers in the column labeled “*OUT*” are of relevance as an indication of overlap or close spacing caused by the modified translator, there is no requirement that interfering contours from the existing station (labeled “*IN*”) not intersect the service contour of the new translator. Page #3 of this exhibit also demonstrates that the modified translator’s F(50-10) interfering contour would not overlap that of any authorized on-the-air station and is in complete compliance with the 47 C.F.R. §74.1204.

Given the lack of interference, a waiver of 47 C.F.R. §74.1204 is relevant.

ERP and HAAT are on direct line to and from reference station. "<" = Contour Overlap

I.F. Analysis

Page 2 of 11

FM translator stations and booster stations operating with less than 100 watts ERP will be treated as class D stations and will not be subject to intermediate frequency separation requirements (see 47 C.F.R. §74.1204 (g)). Therefore, the I.F. relationships of this exhibit can be disregarded.

Guide to Interpretation of Interference Checks

Page 4 of 11

The computer printout should be self-explanatory for the most part. The parameters of the station being checked (reference station) are printed in the heading. The 60 dBu protected contour is predicted from the Commission's F(50-50) table, while the 40, 54, 80 and 100 dBu contours are interference contours derived from the Commission's F(50-10) table. Contour distances are in kilometers and are predicted using spline interpolation from data points identical to those published in Report No. RS 76-01 by Gary C. Kalagian. Critical contour distances are determined using the Commission's TVFMINT FORTRAN subroutine. When interference contour distances are less than 16 kilometers the F(50-50) tables are used. If signal contour distances are less than 1.6 km the free-space equation is used.

The column listed “* IN *” is the sum of the reference station’s 60 dBu protected contour and the data file station’s interference contour subtracted from the distance between the stations. (All distances are derived by the method detailed in Sec. 73.208 of the Rules and Regulations as amended in Docket 80-90.) Therefore, the column is a measure of incoming interference. Negative distances in this column indicate the presence of interference. Listed antenna heights are the average heights of eight standard radials as found in the Commission’s records unless otherwise noted, in which case the specific antenna heights and the DA power, if applicable, along the straight line azimuths between the reference station and the database station are used and visa versa. The column labeled “* OUT *” shows the distance in kilometers of overlap or clearance between the reference station’s interference contour and the database station’s protected contour. Negative distance figures in this column indicate outgoing overlap interference.

Under the “Azimuth” column, the first row of numbers indicate the bearings from True North of the data base stations in relationship with the reference station, while the numbers in the second row indicate the reverse bearings from the database station to the reference station.

The columns labeled “INT” and “PRO” hold the distance in kilometers of the appropriate interference contour and the protected contour of a data base station.

For I.F. relationships the “IN” and “OUT” columns change their significance. The letter “R” stands for the minimum required distance in kilometers, while the letter “M” in the next column follows the available clear space separation in kilometers. Minimum separation distances when displayed are taken from Sec 73.207 of the rules as amended. Canadian and Mexican separation distances, U/D ratios and protected contour values are from the US/Canada Working Agreement.

The first three letters of the “TYPE” column identify the current FCC status of the stations. The fourth letter will be a “D” if the facility is directional. “Z” indicates a 73.215 directional. An ‘N’ indicates it is a 73.215 station that operates omni. The fifth letter will be an E, H or V depending on the type of antenna polarization. The sixth letter will be a “Y” if the antenna uses beam tilt or an “X” if the commission is not sure, otherwise it will be an “N”.

Canadian Compliance Showing

Page 5 of 11

According to 47 C.F.R. §74.1235(d)(3), applications for translator or booster stations within 320 km of the Canadian border may employ an ERP up to a maximum of 250 watts, as specified in §74.1235(a) and (b). The distance to the 34 dBu interfering contour may not exceed 60 km in any direction. Also, according to the U.S./Canada FM Working Arrangement, the concurrence by the other country is not required for FM translators where the 34 dBu interfering contour does not extend beyond the border.

The following pages demonstrate that the proposed translator's 34 dBu F(50,10) interference contour reaches a maximum distance of 38.45 km at the radial 143, with an ERP of 10 watts, and does not extend beyond the Canadian border.
